GauCS 

GESTIONE ADDESTRAMENTI
UNITÀ CINOFILIE
DA SOCCORSO

1

What is G.A.U.C.S.?

Gaucs is a method that uses an objective approach to the work made by a union dog-man named “Unità Cinofila”. This method represents an useful tool involved as:

- **A personal control**
- **A methodological tool for instructors and trainers**
- **An evalutated response in time for judges and examiners**
- **A working monitoring tool uses to have undercontrol the work done by the teams that covers the area**
- **An important method for testing and certificating**

2

Who should use it?

Gaucs is available for voluntary groups, police and all the institutions that involve dogs as a necessary help to find out missing people.

It is useful to acquire a working method aimed to improving the working reliability in knowing the covering area, about the efficiency of the research made, as a training system .

In Italy, the problem of missing people is constantly evolving but also constantly monitored.

The same institutions that manage the research, relating to that aspect of traceability, are addressed to the use of satellite technology to verify the trace made by the equipe involved in the research.

It is important to underline as this increase in reliability helps to solve in a shorter time the emergency; the numbers detected are important, especially because we are talking about human lives, people who could be our relatives.

Now are shown the alarming data transmitted by the Italian Interior Minister:

Missing people	2012	2013	2014
Complaints of missing people from 1974	120.791	133989	149.036
Findings from 1974	94.170	104.784	119.802
People to research from 1974, yet	26.801	29.205	29.234
The Increase of complaints of missing people	10.684	13.198	15.047
Increase of findings	9.515	10.074	15.018
Increase of people yet to research	1.889	2.404	29

*From: xii relazione persone scomparse 2014
del commissario straordinario per le persone scomparse*

3

Why does you should use it?

Thanks to the method GauCS and its relating applications and kit, you can record and store all the data collected during its use and, through regular analysis of the work done, you can identify all the improvements made in the training out of the subjecting critic possibly made by the handler or by the instructor.

The basic prerogative of gauCS is to link the objectivity to its ability to review what you has done.

This, in the review operations helps judges and evaluators to validate the actual preparation of the Dog Units (distance, coverage of the area, motivation, training, etc ...), based on data that result to be less objectionable and therefore more objectives.

The key issue is the aspect of the traceability of the work made that allows you to review what was happened in the real research, so ,it makes possible to highlight the areas already analysed as well as those that may be re-verify.

4

What does make it different?

GauCS is a method of work analyse adapted to be an additional help to the handler of the Dog Units, rescue dogs at first but also useful for funny or sports for example in the cone of smell method or for Mantrailing.

Using this technological tool allow you:

- **To analyze the work done by the conductor, the instructor and by judges or evaluators ;**
- **To control the work done by the technical departments**
- **Verify and analyze the work straight during the real research.**

Finally, method GauCS used for verification and analysis of the resulting data, has been patented in Italy and has already met a positive judgement as an international filing by the European Commission Evaluative EPO (European Patent Office).
